How to Create a Mac Icon to Start the TG Program
(Revision 2 – 2026)

These instructions assume you have installed Anaconda and created a “Photometry” sub-folder in your Documents folder as described at www.aavso.org/tg. The sub-folder should include –

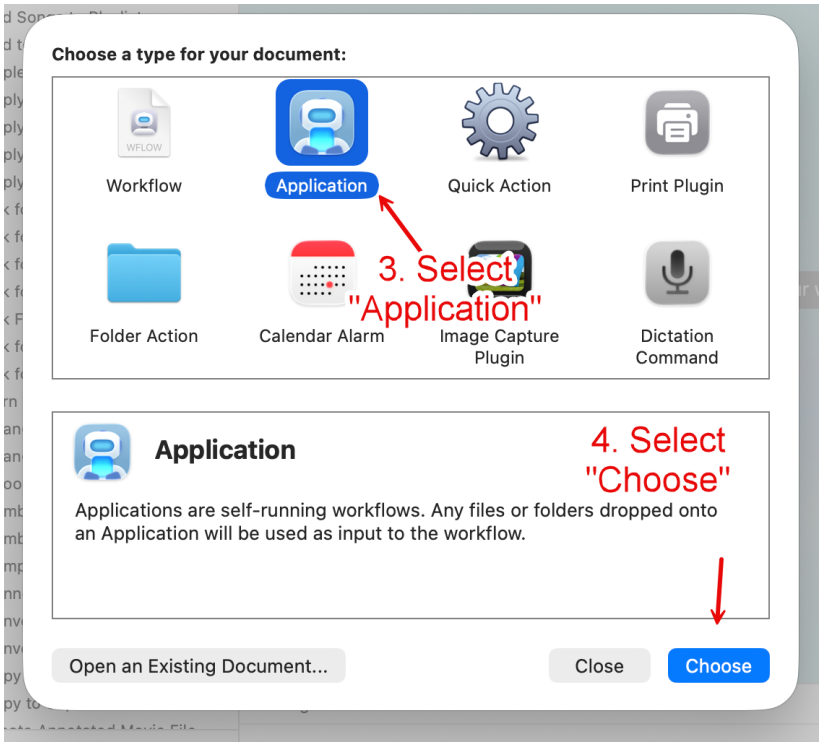

- TG.pyw
- M67_T17_20140330_Photometry_Demo_instrument_mags.txt

The steps to create the TG launch icon in the Launchpad follow:

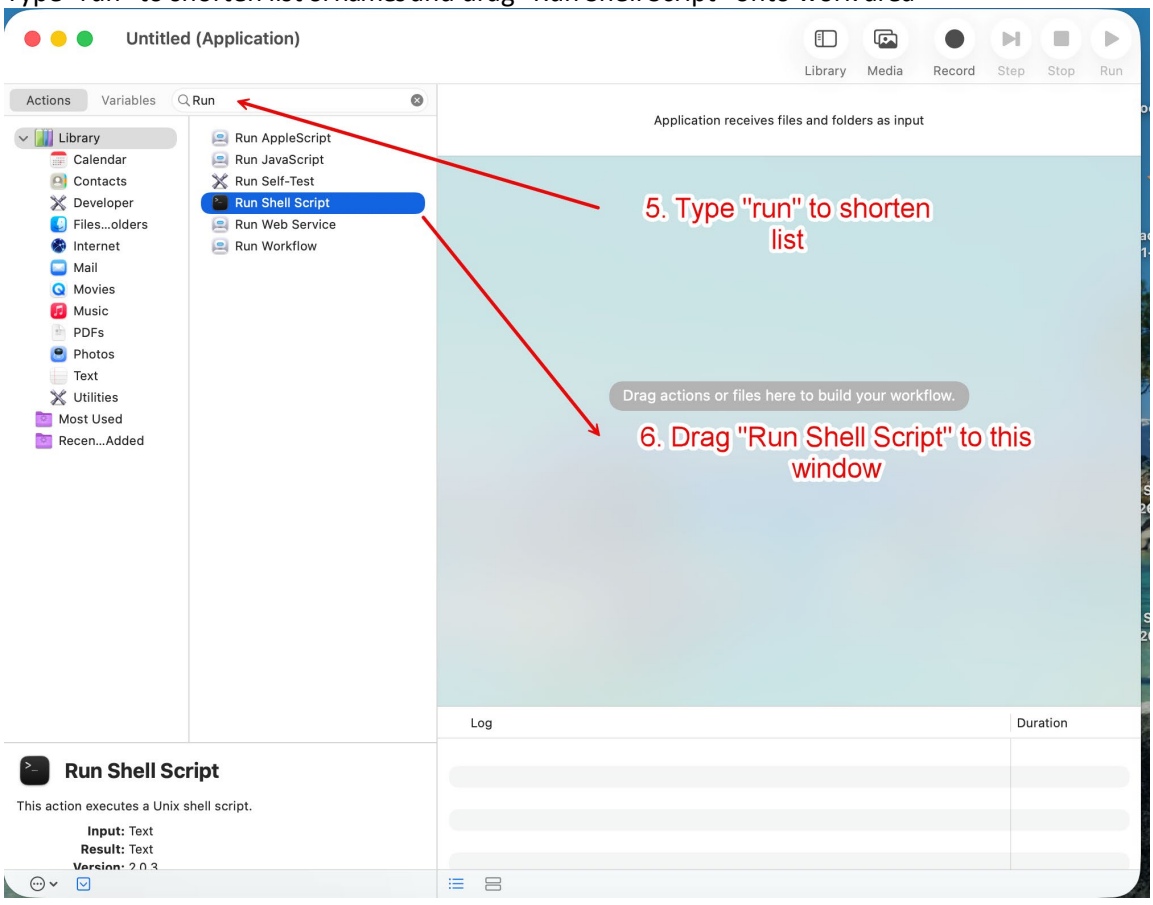

1. On your home page, select the Search icon, and type “automator”. When automator appears, select File->New

2. Select “Application” and click “Choose”

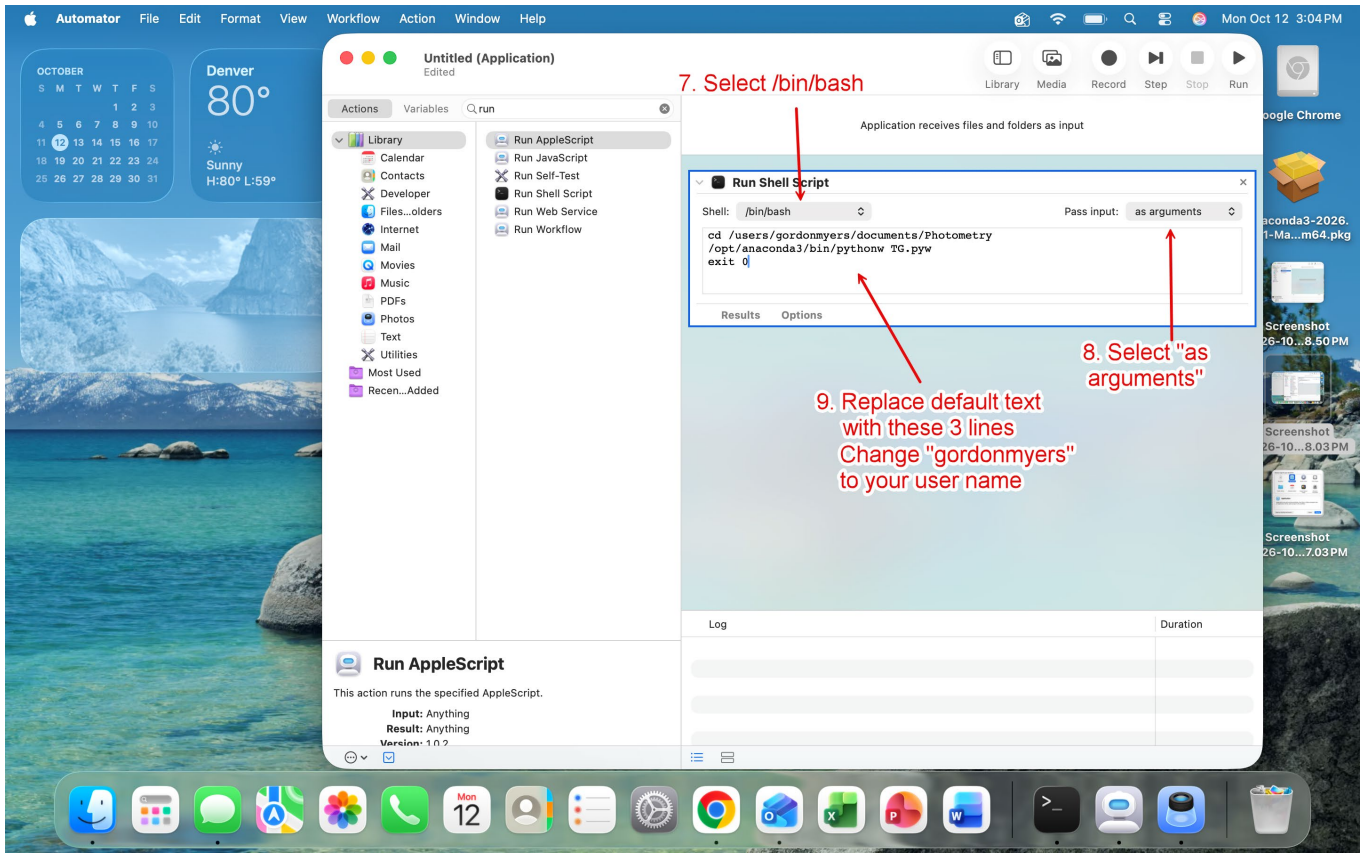

3. Type “run” to shorten list of names and drag “Run Shell Script” onto work area

4. As shown below, select “/bin/bash” , “as arguments”, and then replace the default text with these lines, inserting your user name:

cd /users/yourusername/documents/Photometry
/opt/anaconda3/bin/pythonw TG.pyw
exit 0

Note: Leave a space between ‘pythonw’ and “TG.pyw”

5. Save this launch sequence and create and name the program icon. The icon to start the program will be on the LaunchPad as shown below.
